## OR-800 Advanced

### It was 25 years ago;

the original OR-800 was launched and quickly established the Classic status in Japan. As one of pioneers of today's cable hype, it has been supported tremendously by audiophiles for over two decades. We seized production due to inevitable increase in production cost because of its unique and intricate structure. However, encouraged by overwhelming popularity, we decided to renew this Classic.

After one and a half years of revaluation on materials and methods, the new OR-800 Advance still inherits the original structure and authentic contents but now with improved materials and high-tech sophistication backed by up-to-date technology.

### Conductor:

original fine OFC Litz wire (0.12mm dia.), made into a bundle of 399 strands (7x57) as a core. Being in Litz structure, eliminate disturbed electro-magnetic formation and strain distortion between conductors but advantageous with skin effect to minimize loss of high frequency response.

### Structure:

traditional Star-quad configuration with 4 bundles mentioned, for electro-magnetic shield effect without increased electrostatic capacitance.

### Insulation:

original Cotton thread winding; for overwhelming resonance suppression factor and extremely low; electrostatic capacitance, electromagnetic induction factor and dielectric constant factor. Plastic

compounds are superior for mass productivity but not perfect for those crucial terms for undisturbed signal transport.

Outer Cover: polymer polyolefin compound for low dielectric constant factor (1/3 of vinyl) and fast resonance absorption property.

### Terminals:

terminated with spades to match 6 and 8mm posts, with highly polished 2mm thick solid Oxygen-Free-Copper as the base (cable entry: 5mm I/D), and plating options as follows.

**SPYT;** extra thick Silver-base-plating and Palladium plating to finish, for high speed response and high resolution with extensive sound stage.

**GYT;** extra thick 24k gold plated directly, for lucid and luxurious sound.

SPYT, GYT
